

SHDH1014 Fundamental Visualisation Skills (MID)

Individual Assignment 2 — Digital Animation

Introduction

This assignment is designed to assess your practical capability in creative coding and time-based visualisation, specifically focusing on motion, colour transitions, and interactivity. Drawing from the concepts covered in Weeks 4–7 (digital imaging, programming basics, and image processing with code), you are required to create a digital abstract animation using Processing.

Task (Individual)

In this assignment, you must create a digital abstract animation in Processing that incorporates programmed elements such as motion, colour transitions, or interactivity. The work should demonstrate your understanding of basic programming structures and their application to visual expression.

Requirements:

Code-based animation: The animation must be generated primarily through Processing code rather than pre-rendered video assets.

Visual development: Use shape, movement, colour, and timing to create a visually engaging abstract composition.

Programming concepts: Demonstrate the use of variables, loops, conditionals, or functions to control motion and visual behaviour.

Interactivity or variation: Include at least one interactive element (e.g., mouse or keyboard input) or a clear procedural variation over time.

Presentation / Documentation (if applicable):

Video documentation: Export and submit a screen recording of your animation in MP4 or MOV format (maximum 60 seconds).

Source code: Submit the complete Processing source code (.pde file or project folder).

Written reflection: Include a short note explaining your concept, the programming techniques used, and any challenges encountered.

Submission

File format: ZIP.

Submit the required file(s) to the e-Learning platform (Blackboard).

Deadline: Date: [11NOV2026] Time: HKT [HH:MM]

For proper documentation and assessment of your assignment, please compress the required items into a single ZIP file and submit this file to the e-Learning platform (Blackboard).

Please name your file according to the following format:

"[English full name]_[student number].[extension]"

For example:

"ChanTaiMan_123456.[extension]"

The maximum file size for submissions on the e-Learning platform (Blackboard) is 250MB. Ensure your submission is compressed to adhere to this limit. If you encounter difficulties reducing the file size below this threshold and are unable to upload the file, you have the option to upload your work to a cloud storage service (e.g., Google Drive / OneDrive). After uploading, send the download link to lazarus.chan@cpce-polyu.edu.hk. This should be a last resort only after attempting and failing to compress your materials sufficiently. The timestamp on your email will be taken as the time of submission.

Please name your compressed folder according to the following format:

"[English full name]_[student number].zip"

For example:

"ChanTaiMan_123456.zip"

Plagiarism

You are strongly advised to pay attention to the rules and guidance notes regarding plagiarism, how sources should be referred to, and bibliography referencing as stipulated in the Student Handbook.

The College may take disciplinary actions against students when there is evidence of collusion between individuals. The work of others which is included in the assignment must be attributed to its source (a full bibliography and a list of references must be submitted). Failure to observe such requirements may lead to serious consequences for your study in this subject and your registration at the College. Please refer to the Section "Penalties for Offences" in the Student Handbook for details.

You are also strongly advised to review the hot tips about plagiarism and how to avoid it with reference to the Plagiarism Booklet.

In principle, CPCE considers GenAI tools as positive and creative forces in education and encourages their use in learning, teaching, and assessment. However, extensive copy-pasting from AI-generated content without citation is considered plagiarism.
