

# **SHDH1014 Fundamental Visualisation Skills (MID)**

## **Individual Assignment 3 — Project Development: Redesigning a Walking Path**

### **Introduction**

This assignment is designed to assess your integrated capability in visualisation and time-based media, specifically focusing on concept development, spatial representation, and final presentation. Drawing from the concepts covered throughout the semester, you are required to develop a comprehensive visualisation and time-based experience on the topic 'Redesigning a Walking Path'.

### **Task (Individual)**

In this assignment, you must develop a visualisation project that reimagines an existing walking path or pedestrian environment. The project should combine visual research, concept development, and a time-based or interactive output produced in Processing or Blender. You will present the design process, challenges faced, and final output.

### **Requirements:**

Site research: Select a real or imagined walking path and document its current visual and spatial qualities through photographs, sketches, or notes.

Concept proposal: Develop a clear design concept that addresses user experience, atmosphere, or function of the walking path.

Visual output: Produce a time-based or interactive visualisation using Processing or Blender that communicates your redesign proposal.

Process documentation: Present the design process, including initial ideas, iterations, technical challenges, and how feedback informed the final work.

### **Presentation / Documentation (if applicable):**

Final output: Submit the final animation, interactive file, or rendered sequence in an appropriate video or project format.

Presentation slides: Prepare a short presentation (5–7 slides) summarising the concept, process, and outcome.

Documentation: Include source files, screenshots, and a written reflection of approximately 300 words.

### **Submission**

File format: ZIP.

Submit the required file(s) to the e-Learning platform (Blackboard).

**Deadline: Date: [02DEC2026] Time: HKT [HH:MM]**

For proper documentation and assessment of your assignment, please compress the required items into a single ZIP file and submit this file to the e-Learning platform (Blackboard).

Please name your file according to the following format:

"[English full name]\_[student number].[extension]"

For example:

"ChanTaiMan\_123456.[extension]"

The maximum file size for submissions on the e-Learning platform (Blackboard) is 250MB. Ensure your submission is compressed to adhere to this limit. If you encounter difficulties reducing the file size below this threshold and are unable to upload the file, you have the option to upload your work to a cloud storage service (e.g., Google Drive / OneDrive). After uploading, send the download link to [lazarus.chan@cpce-polyu.edu.hk](mailto:lazarus.chan@cpce-polyu.edu.hk). This should be a last resort only after attempting and failing to compress your materials sufficiently. The timestamp on your email will be taken as the time of submission.

Please name your compressed folder according to the following format:

"[English full name]\_[student number].zip"

For example:

"ChanTaiMan\_123456.zip"

## **Plagiarism**

You are strongly advised to pay attention to the rules and guidance notes regarding plagiarism, how sources should be referred to, and bibliography referencing as stipulated in the Student Handbook.

The College may take disciplinary actions against students when there is evidence of collusion between individuals. The work of others which is included in the assignment must be attributed to its source (a full bibliography and a list of references must be submitted). Failure to observe such requirements may lead to serious consequences for your study in this subject and your registration at the College. Please refer to the Section "Penalties for Offences" in the Student Handbook for details.

You are also strongly advised to review the hot tips about plagiarism and how to avoid it with reference to the Plagiarism Booklet.

In principle, CPCE considers GenAI tools as positive and creative forces in education and encourages their use in learning, teaching, and assessment. However, extensive copy-pasting from AI-generated content without citation is considered plagiarism.
